How to fold the 8-page zine

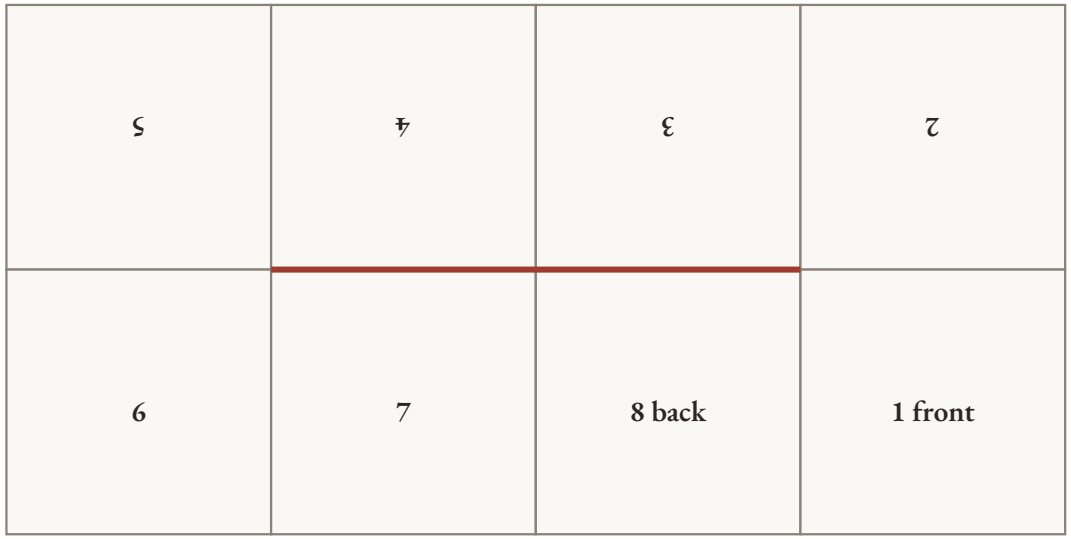

一張紙摺成八頁小誌

1. Print the sheet at 100% / “Actual size” (not “Fit to page”), landscape, one-sided.
2. Fold it in half the long way (top edge to bottom edge), crease, unfold.
3. Fold it in half the short way, crease, unfold. Then fold each half again to the middle: 8 panels.
4. Fold it in half the long way again. Cut along the middle crease, ONLY across the two centre panels (red line).
5. Open it, fold long-ways again, and push the ends together so the cut opens into a diamond / plus shape.
6. Flatten it into a booklet, front cover (page 1) on the outside. Crease all edges firmly.

Why the top row is upside down: when you fold, those pages turn over and end up the right way up.

Tip: phone photos with EXIF rotation are fixed by zine.py automatically.

Tip: home printers can't print the last ~4 mm at the edges; full-page photos get a thin white rim there. That's normal.

red = the only cut. Top row prints upside down on purpose.

Reading order after folding:

1 front cover → 2 → 3 → 4 → 5 → 6 → 7 → 8 back cover
